

Data analysis for digestate experiments

Sasha D. Hafner

14 October, 2022

Plots

```
ggplot(dat, aes(exper, e.rel, colour = treat)) +  
  geom_jitter(height = 0)
```

```
ggplot(dat, aes(as.integer(factor(exper)), e.rel, colour = treat, group = interaction(treat, rep))) +  
  geom_point() +  
  geom_line()
```

```
ggplot(dat, aes(exper, e.rel, fill = treat)) +
  geom_boxplot() +
  ylim(0, 25)
```

Stats

Set reference to untreated cattle manure.

```
dat$treat <- factor(dat$treat, levels = c('U-CM', 'CC-CM', 'D-CM'))
```

```
m1 <- aov(e.rel ~ treat + exper, data = dat)
summary(m1)
```

```
##           Df Sum Sq Mean Sq F value    Pr(>F)

```

CC-CM and D-CM are clearly different. But neither is clearly different from the reference. Makes interpretation just a bit tricky. Some evidence of a difference but presumably digestion pH effect is moderated by low DM, and variability was high, so power is low.

Check residuals.

```
plot(m1, ask = FALSE)
```

Looks fine, no need to transform.
